

DROPHELP / TWISTED

AI-Powered Evidence Ingestion & Multi-Agent Analysis Platform

Overview

DROPHELP ingests messy, real-world evidence — PDFs, images, audio, text, spreadsheets — and runs them through a swarm of specialized AI agents that analyze, cross-reference, and produce actionable reports.

The frontend ("TWISTED-brutalist") is a React Flow canvas with brutalist monochrome design. Three-step flow: Who (describe the problem) → What (drop evidence) → Watch (swarm agents collaborate in real-time). The backend orchestrates 16+ AI agents using OpenRouter free models with circuit-breaker fallback chaining.

Current Status

- Frontend: Complete. React + Vite + Tailwind v4, builds clean.
- Backend: Complete. FastAPI with 30+ endpoints, WebSocket swarm streaming.
- AI Gateway: Complete. 17 curated free models, tiered retry, circuit breaker.
- Evidence pipeline: Upload to parse to embed to store to analyze.
- Admin dashboard: Live system health, provider status, token telemetry.
- Examples: Full test evidence set (Northridge city dispute scenario).

Budget

Backend development	\$15,000
Frontend development	\$10,000
AI model costs (6 months)	\$3,000
UI/UX polish and branding	\$5,000
Hosting infrastructure (12 months)	\$2,000
Testing, QA and security audit	\$5,000
Contingency (15%)	\$4,500
Total	\$44,500

Timeline

Month 1-2: Core Platform

Beta launch with core swarm Week 8

Month 3: Polish

UI refinement and testing Week 12

Month 4: Launch

Public release and demo

Week 16
